USER INTERFACE DESIGN

EXPERIMENT 2 – MEMORY RECALL INTERFACE DESIGN

Name: Roshni R **Reg no:240701443**

Aim

To create an interactive Memory Recall interface that evaluates a user's short-term memory using a timed visual activity.

Introduction

This experiment focuses on designing a simple and engaging memory testing interface. The task displays a group of visual elements (icons/images) for a short duration. After the viewing phase, users are required to identify the items they remember from a larger set of options.

The interface is designed to be clear, minimal, and easy to navigate, ensuring that users focus primarily on the memory task rather than distractions.

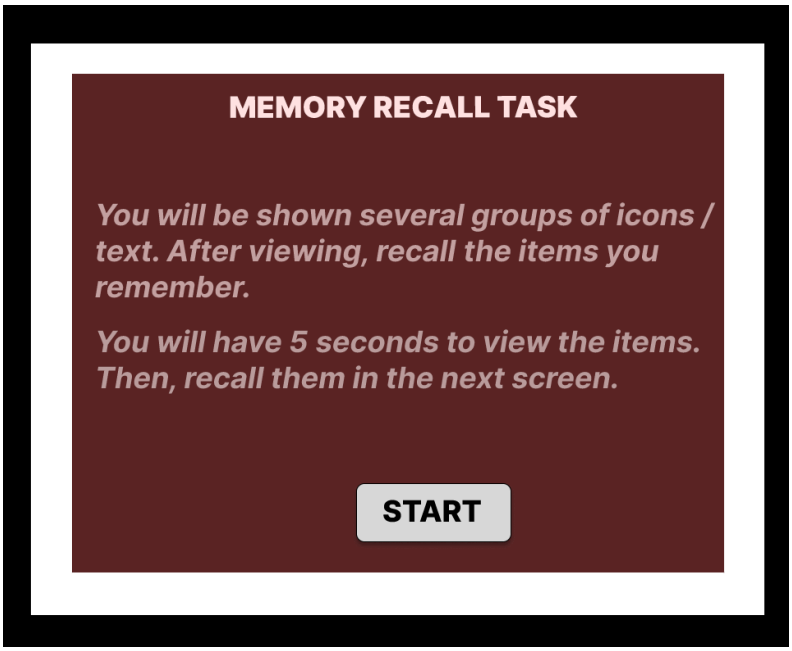
Interface Structure

The application is divided into four main screens:

1. Instruction Screen

- Displays the title **Memory Recall Activity**.
- Provides short and clear instructions about the task.
- Informs users that they will have **5 seconds** to observe the items.
- Includes a clearly visible **Start** button to begin the activity.

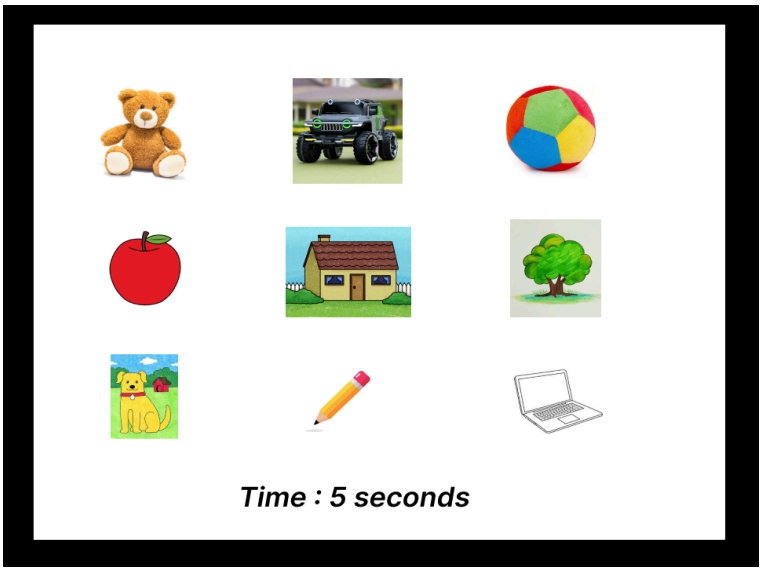
This screen prepares the user before starting the task.



2. Observation Screen

- A set of icons (such as objects, toys, fruits, etc.) is displayed.
- Items are arranged neatly in a grid format for better visibility.
- A 5-second timer is shown to indicate the viewing duration.
- The layout is distraction-free to improve concentration.

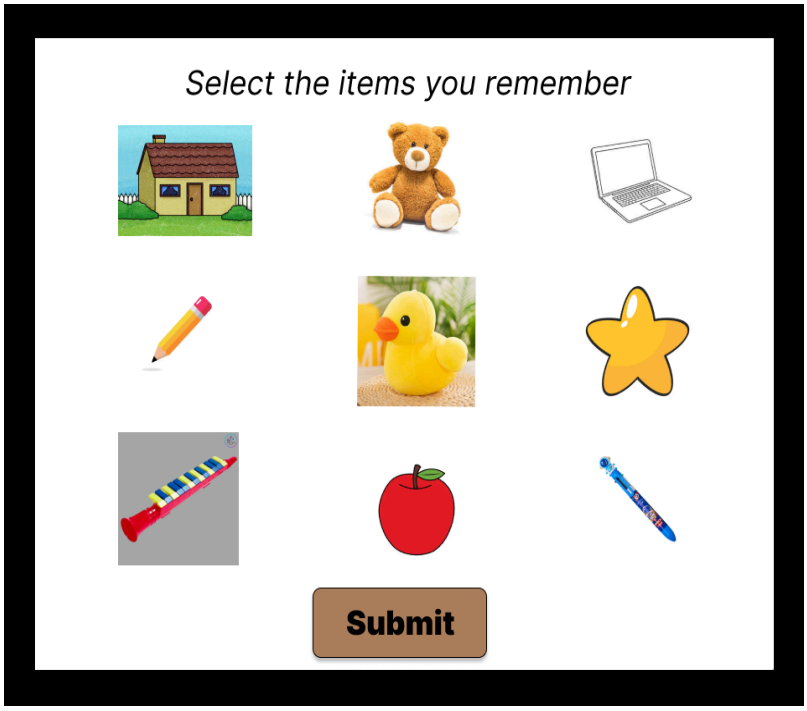
After the time ends, the user automatically moves to the next screen.



3. Recall & Selection Screen

- Displays a larger collection of icons.
- Some items are from the previous screen, while others are new.
- Users must select the items they remember seeing.
- A **Submit** button is provided to confirm their choices.

This stage actively tests the user's recall ability.



4. Result & Feedback Screen

- Shows the number of correctly recalled items (e.g., 4 out of 5).
- Displays a motivational message such as:
  “Well done! You have strong memory skills.”
- Feedback is positive and encouraging to enhance user experience.

Design Improvements & Key Features

1. Simple Navigation Flow

The interface follows a clear progression:
Instruction → View Items → Select Items → View Results

This ensures smooth interaction without confusion.

2. Visual Clarity

- Balanced spacing between icons.
- Clear typography for headings and instructions.
- Proper alignment for better readability.

3. Interactive Elements

- Functional Start and Submit buttons.
- Selectable icons to make the activity engaging.

4. User-Friendly Design

- Minimal color usage to avoid distraction.
- Easy-to-understand instructions.
- Instant feedback after task completion.

Conclusion

The Memory Recall Interface successfully demonstrates how UI design can be used to create a structured and interactive cognitive task. The improved layout, logical flow, and positive feedback system enhance both usability and user engagement.
